#### Abstract

Newspaper reading is the easiest means of getting up-to-date information with facts. It makes a man to be considerate and practical in a democratic and civilized society. Reading newspapers in forming public opinion and the people can access all news and updates at their fingertips. Even in this digital world, newspapers in the print form rule out the sleep of passionate readers who are waiting for their morning dailies. Newspaper reading, catering to diverging tastes and outlook, thus has become embedded into the daily lives of people. Conducting a survey with 352 Students pursuing higher education in Arts and Science colleges in Haryana, under a multivariate statistical framework, this research investigated the users' motivations and value importance to the reported news from the readers' perspectives in Haryana. The study employed multi - dimensional scaling (MDS) technique to segment the newspaper market according to the perceived similarities in the respondents' motivations, and the findings offer evidence for the presence of diverging motives among young readers in the State. Multiple discriminant analysis administered in the research was able to make out the perceptual differences of readers based on their newspaper choices. The findings suggested the presence of two dimensions of discrimination among the newspaper brands language simplicity and news credibility on one side and political bias and coverage of news on the other end. Language simplicity along with political reasons separated Dainik Bhaskar newspaper brands from the leading Hindi dailies, while the latter were favored in terms of the quality of news contents. In sum, youth in Haryana was inclined to adopt a utilitarian approach towards newspaper reading. Hence, the newspaper brands should be more familiar with the perceptual differences among the readers on a wider and richer perspective based on which they should design dissemination strategies to expand their business frontiers.

*Keywords:* Motivation, Political bias, Quantity of News Socio-economic Development, Information.

#### 1. INTRODUCTION

Modern man gets much of his information from the press. Newspapers are the creations of profession initiatives and have a significant role in publicizing information relating to the newest trends and events happen in national and international contexts. Newspapers maintain strong presence in the communities in a shifting media setting based on their relative influence in public affairs and trust among citizens (Boswell, 2000) modern newspaper virtually covers every sphere of human activity that includes economics, politics, education letters, business, sports, movies, and others. It widens the scope of our knowledge and outlook; thereby, we become part of an elegant society. A newspaper is a tool of preaching positive thinking despite its abused weapon of propagating wrong ideas.

Print media is one of the cheapest, but right medium to facilitate quick dissemination of information. Newspapers report a wide range of news that has social relevance and that demand attention of the public. However, everyone, due to their busy daily routine, go through the newspapers only for the sections that appeal to them the most. When looking for newspapers, people are usually interested in those that integrate their beliefs and help them to take in their identity. It would be highly imperative for the publishers to bring out the creations that increase the readership and circulation.

Everyone in today's modern and fast changing society, despite their income or affiliation, wishes to be informed about all aspects of human lives. Information is the prime commodity of the present age (2002). In society, the quality of life and the prospects of both social and economic development depend more and more on information and its efficient usage (Martin, 1995). The awareness and admiration of significance of information for socio-economic development led to the development of the information structure **(Ojiambo, 1992)**.

Newspaper reading is the easiest means of getting up to date with facts. It makes a man to be considerate and practical in a democratic and civilized society. Reading newspapers in forming public opinion and the people can access all news and updates at their fingertips. Even in this digital world, newspapers in the print form rule out the sleep of passionate readers who are waiting for their morning dailies. Newspaper reading, catering to diverging tastes and outlook, thus, has become embedded into the daily lives of people. Newspaper reporters or journalists, on the other hand, should infuse a sense of social responsibility among them while providing news, views, and analyses on various issues important to the advancement of the society.

The newspaper market in India is growing very fast, fuelled by strong economic fundamentals and demand from an emerging urban and literate middle class with higher purchasing power and rising standards of living. Literacy rate in rural areas was pegged at 71% in 2014, compared to 86% in urban areas (NSSO, 2015). Increased literacy is playing an important role in the impressive ascent of the newspaper industry (Nolen, 2011). India is in the second position among the world's five top countries in terms of daily circulation of newspapers (world association of newspapers and news publishers, 2010). Moreover, the economy has gained relatively significant growth during the post reform period. Such growth creates a new, more literate consumer class, and the country's print industry has been growing at a notable rate of about 10% since the last few years. Another important reason for this growth is that the newspapers in India are shared communally and Indians now increasingly prefer to buy their own paper.

-500-

Growing literacy rates, particularly in regional languages, has widened the potential readership base .This observation is relevant in the context of Haryana. The state has always been a star performer in terms of Human Development Index in India with higher literacy rate and improved standard of living. Haryana has achieved an effective literacy rate of 93.91%, which is much higher than the national average (Planning Commission, Census Report, 2011). The high literacy rate holds up large circulation publications in Hindi language. The continuing literacy growth and the expanding income base of a growing population will not let down the newspaper market of Haryana. However, the aspects like the content and depth of news, segmentation choices, credibility and impartiality of news, after all emotional attributes delivered are extremely important in determining their success. The newspaper publishers should make out the value importance and instrumentality of the news they report from their reader's perspective. A research of this kind is a great way to find out how the newspapers are doing from their reader's perspectives.

# 2. **REVIEW OF LITERATURE**

At first, the study roots it's rationale from the literature on readership bias which shows the existence of heterogeneity among readers in terms of preferences and motivations. Chaudhry and Low(2009) attempted to adopt a pragmatic and utilitarian approach towards reading. The editorial content of the newspaper made it distinct and positioned it in the first place in yielding information to the readers (Meyer,1985). Flavian and Gurrea (2009) corroborated the significant positive association of readers motivation with the knowledge of latest news exploration for specific information, and search for updates in the newspaper market. Nevertheless, entertainment holds an inverse relation with the readers preferences. News should be reliable in priority, and exaggerated net has least preference among youth (Costera Mejjer, 2007). Fendrick (1941), based on his applied research among high school and college Students, proved that ideologies and excitements appear to preponderate among the factor that influence the readers reading interests. Newspapers are the base of the entire media channel, herald new game, and guide other new sources. Readers favored newspapers whose thoughts agreed with their own (Gentzkow & Shapiro, 2010). Webster and Phalen (1997) claimed that people have ultimate aims to seek out new but the media setting significantly influences them. Media could directly influence the effectiveness of even social campaign (Mendirata & Mehta, 2011). However, in recent times, social media has been taking over significant role in dissecting the details of each piece of news in spread (Sharma 2012).

With regard to the reading barriers also, the research is relatively extensive. Newspapers can equip reader particularly Students, with reliable information, knowledge, and insights, to find the needed edge to become successful in their professional as well as social career (Channaptna & Awari, 2015). Oliveras, Marquez and Sanmatri (2013) were able to detect some of the aspects of critical thinking where the Students have the most difficulties in identifying the writer's purpose and searching for evidence in a text.

Newspaper reading and reader preferences and motivations in general have often been a topic of interest in both business and behavioral research. Prior scholarly studies probing into different dimensions of newspaper marketing and readers' perception form the basic literature for most of the studies in the area. My research mainly stems out of three streams of literature: (a) work

-501-

studying the reader preferences and motivations among youth,(b) problems faced by them, and (c) strategic focus of newspaper firms in the market.

**Zerba** (2004), based on his survey, identified inconvenience and lack of time as the rime reasons for not reading newspapers by the younger generation. General newspaper research executed in studies like **Lauf** (2001) Found to be variables, including the role of habit, surveillance needs, and social environment as the major reading barrier among youngsters. However, regular access to a newspaper at home was able to develop reading habits among the youngsters, and they might be inclined to spend more time for reading (**Bogart,1989**). Moreover, the parents reading behavior moulded the children's reading habits in the early days of childhood itself (**Peiser,2000**).

A strategic shift in the newspaper market is quite revealing in many studies. Earlier, for withstanding the competition and to sustain themselves in the market, newspapers went for the change in the material aspects such as : publishing more pictures, color spreads, less editorials, and increase the size of headlines (Zhou, 2005). The newspaper publishers should think graphically which in other ways means to invite the reader into each page with attractive, provocative, and orderly use of photos, typography, and illustrations (Garcia,1981).

**Gentzkow**, **Petek**, **Shapiro**, **and Sinkinson (2012)** analysed the strategic orientations of media firms under competitive framework, and their findings showed that competition in the media market during the beginning years of the 20<sup>th</sup> century forced newspapers in many countries, including the U.S. to embrace different ideal personal political views of the editor truly reflected in the editorial position (Balan, De Graba, & Wickelgren, 2009; Weaver & Wilhoit,1996).

Larkin and Grotta (1976) portrayed the consumer attitudes towards the use of advertising content in a small daily newspaper. Their study found that the advertising content of the newspaper was viewed as local news by subscribers and subsequently had the highest readership. Moreover, most of the respondents recorded positive attitude towards advertisements and preferred to see more advertising in the future. However, the empirical way of Levy and Nielsen(2010) attributed the recent declines of news industry to their over dependence on advertisements for revenues and to the reverberations of global recession. The study found that the impact of internet's research as spread was least on this issue.

Some related literature in newspapers (**Reddaway**, **1963**; **Rosse**,**1970**) highlighted the significance of fixed costs in advertising, circulation, and content development and the consequential formation of well-focused markets with fewer product options. During the times of declining demand for products, normally, it is optimal the producers to go for price cuts (**Tirole**, **2007**). Studies like the ones of **Parker and Van Alstyne** (**2005**) claimed that since newspapers derive their revenues from two sources, that is, readers and advertisers, the prices at the receiving side(readers) might be subsidized at the cost of the other side (advertisers). With the dissemination of free news through digital sources and news aggregators like Yahoo, readers were more and more reluctant to pay for the print newspapers (**Fllows**,**2010**;**Lisa**,**2008**). However, in a survey conducted among Boston Globe Editorial employees, **Barthel (2016)** found that around half of the newspaper readers relied only on the print edition. **Weber and Poyar (2012) and Filloux(2012)** suggested that newspapers must focus on small that the librarians in India preferred digital dailies to print media.

-502-

On reviewing the literature, it is obvious that the studies on newspaper reading are relatively scanty in India, particularly with reference to Haryana. In fact, the research exploring the newspaper reading behavior and the underlying dimensions in the context of a high literate state like Haryana have yet to come out. The high literacy rate with its continuing momentum and the consolidating earnings conditions in the state offer ample scope for the further growth of the newspaper market in Haryana. Therefore, the present study expects to fill research gap in the sphere of newspaper research by providing some convincing exhibits on how can the newspapers in Haryana better off their readership base by designing news contents that ensure at least minimum level of acceptable values, which will vary with the information needs and wants of individuals.

### 3. DATA AND METHODOLOGY

The theoretical underpinnings and the related empirical literature enable the current research to develop a conceptual framework. The study groups the variables explaining the reading behavior of the underyling variables explaining each of these behavioral components separately using appropriates scaling techniques.

Given the nature of the research, the study made formal quantitative data collection using survey method. The sample for this study covers 352 Students who were pursuing under graduate or post graduate education in colleges in Haryana. The study considered Arts and Science (Govt. or private Aided) colleges in the states and chose 15 colleges (five each from three regions) as the primary sample units. Then the teaching departments of the selected colleges were identified under four broad streams: Science, Commerce, Humanities, and Literature; and 88 Students from each stream were picked. My personal Judgment formed the basis for the final sample selection.

The survey was made during the month of April 2018. The survey instrument used in this study consisted of four parts. In the first part, Students were asked about their demographic conditions. In the second part, they were asked to rank the major attributes that determined their motivation behind the reading of newspapers. The questions in the third part of the survey asked about the determinants of newspaper choices.

Some descriptive statistics relative to the sampled consumers are reported in the table 1. Majority of the respondents (57.4%) were women (Table 1). In recent times, in colleges in Haryana, the women Students outnumber the men Students; hence, more participation of women in the survey definitely ensures better representation. The under graduate Students formed a large chunk of the participants. Most of the Students belonged to the age group of 18 to 20 years. The maximum age of a student who is pursuing higher education in Haryana is normally 22 years. Indeed, only a marginal part of the respondents were above the 22 years category. Furthermore, average annual family income of the respondents was relatively low. Approximately one-half of the sample respondents family earning income was between Rs. 1 lakh per annum and 36% of the respondents lived in a 4-people family (two children), while people that lived in families formed by five or more people (three or more children) amounted to 42%. Families with a single child were negligible (6%).

Demographic Variable	Category	NO. of Respondents	%	Demographic Variable	Category	No. of Respondents	⁰∕₀
Gender	Male Female	150 202	42.60 57.40	Age (Years)	18-20 20-22	272 69	77.23 19.6
Course	UG PG	278 74	78.98 21.02	No of Family Members	Single Child Two Children Three or more Children	21 183 148	6.9 52.3 42.5
Annual Family Income (Rs.)	Below1 lk 1-5 lakhs Above 5 Lakhs	173 127 52	49.15 36.08 14.77		Cimuren		

Table 1. Descriptive Statistics of the Sample Respondents

Source: Primary Data

### 4. **RESULTS & ANALYSIS**

Analysis is performed in three steps. First, scale reliability was tested based on Cronbach's alpha. Secondly, employ multi-dimensional scaling (MDS) techniques to reader's motivations spatially by means of visual display. The third step consists of a multiple discriminant analysis to differentiate the popular newspaper brands in Haryana in terms of the news attributes. This part discusses the results of the analytical methodology pursued along with its practical implications assessing the reader motivations and preferences in the newspaper market of Haryana. As mentioned earlier, at find we compute the Cronbach's alpha for testing the reliability of the scale used in the research. The computed Cronbach's alpha coefficient of 0.824 indicates the scale used to measure the perception of readers was highly reliable. The further discussions are spanned into two sections. The first section evaluates the reader motivation using MDS procedure, and the results on discrimination among popular newspaper brands in terms of their news attributes are corroborated in the second section.

**4.1 Readers' Motivation in Newspaper Market- Multi- Dimensional Scaling:** The table 2 reports that preference ranking of newspaper attributes by readers. Most of the respondents who participated in the survey considered newspaper reading as the prime source of their information search. According to 94% of the sample respondents, they read newspapers primarily to get information or to broaden their general knowledge. Among them, 70% read papers for gaining daily information and 24% of the respondents considered newspaper reading as a source for widening their general knowledge, 7% each give prime importance to getting employment.

-504-

Sr. No.	Reading Purpose	Preferences				
51. NO.	Reading rurpose	Ist (%)	IInd (%)	IIIrd(%)		
1	To get information	70(47.3)	17(11.5)	17(11.5)		
2	To broaden the horizon of general knowledge	24(16.2)	41(27.7)	16(10.8)		
3	For educational purpose	11(7.4)	19(12.8)	18(12.2)		
4	Entertainment	7(4.7)	16(10.8)	17(11.5)		
5	To know the sports news	6(4.1)	6(4.1)	13(8.8)		
6	For getting various employment news	7(4.7)	7(4.7)	7(4.7)		
7	To know political news	1(0.7)	6(4.1)	10(6.8)		

### 4.2 Table 2. Purpose Of Reading Newspapers By The Respondent

Source: Primary Data

#### Table 3. Matrixx Stress

Variable Matrix	Stress	<b>R</b> <sup>2</sup>
	0.03725	0.98975

Up to date about happenings of the world through news paper reading. Knowing sports news was 6% of the respondents and all other purposes were secondary to all most all readers. Multi dimensional scaling (MDS) is a powerful mathematical procedure that can have systematize data by similarities of objects spatially as in a map (Schiffman, Reynolds, & Young, 1998). It describes a set of questions that deal with property space in a more general way which is possible to scale objects, or both with minimum of informations. MDS procedures, which use direct similarity or dissimilarity as inputs, have the advantage of being low in experimental contamination (Krishnaswamy, Sivakumar, 2013). They do not need a – prior knowledge of the attributes of the stimuli to be scaled. MDS is by respondent judgement concerning the degree of similarity of pairs of stimuli on. The scale value reflects the similarity or dissimilarity of each stimulus pan. In addition, this concept of distance is centered to the theory behind MDS as a measurement technique.

The author has examined the motives of the Students in newspaper reading by using MDS. The respondents to rank their intentions behind reading newspaper from the most preferred to least preferred, they gave their responses on seven aspects that included keeping up to date with the world; Widening base; for educational needs; getting information on employment opportunities; interest in politics and entertainment. When the spatial maps are based on preference data, distance implies the differences

The index of fit or R<sup>2</sup> should be examined to decide how well the MDS model fits the input data. The value of R<sup>2</sup>, 0.9897(Table 3) indicates that almost full proportion of variance of the optimally scaled data explained by the MDS procedure, which perfectly fits the input data. Stress value on the other hand, badness of fit. Such value measures the proportion of variance of the optimally scaled data, which is unexplained by the MDS model. A stress value less than 5% indicates the excellent reproduction of the **(Krishnaswamy et al, 2013)**. Hence, the stress value of 0.0372 warrants a fair fit and indicates a good solution.

The preference data provides a simple rank order of the motives according to the readers' choice. The MDS enables newspapers brands in Haryana to have a better understanding of what most important to readers and the knowledge which can help them to leverage their positioning in the market.

In this spatial representation, each motive is identified by its distance from other motives. The closer the motives (general knowledge and up- to- date information), the more similar they are perceived to be. These parts are showing two intensions (entertainment and education), the less similar they are. Small distance indicates greater similarity between reader motives. To illustrate the motive, 'for getting general knowledge' closely with 'the need of up to date information' and 'education news' to any extent, but it contradicts with 'entertainment news and political base news'. The position of different reader groups can be easily determined and the newspaper dailies can designed their strategies accordingly.

Often, the dimension represents more than one attribute. The configurations can be interpreted by examining coordinates and relative position of the motives. Motives located near to each other considered similarly isolated motive creates a distinctive reader group. Motives those are farther along in the direction of a reveal diverging reader groups.

**4.3 Youth preferences In Newspaper Market- Discriminant Analysis:** People reading newspaper generally has a unique perception towards different newspaper brands. If a researcher would like to identify newspaper attributes, which discriminate newspaper brands, he/she can develop attribute-based perception map using discriminant analysis.

Discriminant Analysis is the appropriate statistical technique when the dependent variable is a categorized variable and independent variables are metric variables **(Hair,Black, Anderson, & Tatham,2012)**, The dependent variable consists of two or more groups/ classifications. The analysis involves a variate, which is combination of independent variables that will discriminate best between objects. We can derive the variate for discriminant analysis (also known as discriminant function) from equation (1) and involves the line combinations of the following:

	D.B.						S
	D.D.	1.10.	101	1.1.	Lambda	1	0
Simple	4.69	4.76	3.67	3.79	0.605	61.545	0.0
Language							
News Content	4.25	4.34	4.47	4.57	0.977	2.248	0.0
Political	4.18	3.08	3.20	3.82	0.696	41.217	0.0
Reasons							
Credibility	4.02	4.44	4.27	4.04	0.887	11.976	0.0
News Coverage	4.27	3.97	4.43	4.21	0.948	5.178	0.0

$D = b_0 + b_1 x_1 + b_2 x_2 + b_3 x_3 + \dots + b_k n_{k-1}$	
Table 4. Group Statistics and Test of Equality for the Estimation Sample	5

---(1)

Note: \*significant at the 1% level

Source: Primary data

DA is the appropriate statistical technique for testing the hypothesis that the group mean of a independent variables for two or more groups are equal. To do this for the study, I have taken newspaper brands as groups and newspaper attributes as brand discriminating variables. Thus, the dependent categorical variable is a newspaper selected by respondents from a set of four

-506-

leading newspapers dailies (Dainik Bhaskar, Punjab Kesri, Times of India and The Tribune), and independent variables are five newspaper with simple language, quality of news contents, political bias, credibility of news published and coverage of news. The respondents had to rate their perceptions on a 5-point scale based on the importance they gave to these while choosing a specific newspaper brand. As mentioned in the methodology part, the study collected in this regard from 352 Students who were pursuing higher education in colleges in Haryana, to select newspaper brands and rate attributes on importance. I split the sample further into analysis and held out samples of 65, respectively.

Initially, the mean scores should be analyzed for each group to make visual inspection of the independent variables to know whether they discriminate among the groups or not. Also, there is a need to report values of Wilk's Lambda and univariate F ratios for each independent variable to infer its statistical significance. A maximization of group means reported in Table 4 indicates that language simplicity appears to separate the newspapers brands more widely than other performance parameters. Both of the Hindi Dailies are much closer terms of this parameter and such relation subsist between English dailies. Hence, this variable provides discrimination between the Hindi Dailies and English Dailies. There also exists considerable separation in political bias and credibility of the news. The political bias provides discrimination, in varying degree between all the newspaper brands simultaneously. Substantial variations are evident for group means of news coverage and it at a relatively higher scale between the Hindi and English Dailies. The content of news covered by both Hindi and English Dailies are found to be similar despite marginal differences in their grouped means.

Wilk's Lambda and the F test are the typical measures of significance of differences across groups (Malhotra 2011). However, they access the overall differences and do not guarantee that each group is significant from others. Accordingly, the validity of the inferences on their overall differences largely depends upon the presence of individual group differences. On a univariate basis, four out of five attributes display significant differences between their grouped means. It is evident that language, political bias, credibility and news coverage significantly discriminate newspaper brands, while news contents do not exhibit significance in this regard. Most significant variables have the lowest Wilk's Lambda values , which add to the validity of the findings. Although greater statistical significance corresponds to higher overall discrimination , it does not always correspond to the greatest discrimination between all the groups.

Step	No. of Wilk's		df	F	P value	
	Variables	Lambda				
1	1	.605	287	61.545	0.000*	
2	2	.403	287	54.033	0.000*	
3	3	.324	287	44.803	0.000*	
4	4	.300	287	35.587	0.000*

The Tril	bune	F		28.994(0.000*)		39.112(0.000*)		1.640(0.1	64)	
		Table 7:- Su	mmary o	of Can	onical Discr	iminant Fu	nctions			
Function	Eigen	% of	Cumul	ative	Canonical	Wilks	Walk's	Chi-	Sig	
	Value	Variance	%		Correction	Lambda	Lambda	a square	Ū	
								df		
1	0.935	56.5	56.5		0.695	0.300	339.505	12	0.00	
2	0.716	43.3	99.	8	0.646	0.581	153.365	6	0.00	
3	0.004	0.2	100.	.0	0.061	0.996	1.063	2	0.58	

The information provided in Table 5, Table 6, Table 7 summarizes the steps of the four group discrimination analysis with the following results. The attributes of simple language, political reasons, credibility, and coverage of news are the variables in the final discriminant function. The overall model fit id statistically significant and all the variables to be included in the function have significantly higher values of 'F to remove'.

Discrimination increases with the addition of each variable, which is evident from the declining Lambda value (Table 5). By comparing the final Wilk's Lambda for the discriminant analysis (0.30) with the Wilk's Lambda for the best result from a single variable (political reasons), a striking improvement in the discriminant function through consideration of most of the variables in the model is observed. With no variables reaching the significance level necessary for addition or removal, the step-wise procedure terminates.

The last section of Table 6 provides the significance test for group differences between each pair of newspaper brands. The table 6 reveals that all pairs of brands except that of English dailies show statistically significant differences, denoting that the discriminant functions created separation not only in the overall sense, but for more brands as well.

Among the three functions that were used in the analysis, the first two functions are statistically significant (table 7). The values of Wilk's Lambda are relatively low and statistically significant at the 1% level. The Lambda value of the third function is not found to be significant at any level. The first and second functions, respectively account for 56.5% and 43.3% of the variance explained by the three functions. The contribution of the thing function is negligible and is not considered in further procedures. The total amount of variance explained by the first functionis (0.695)<sup>2</sup>, that is 48.3%, while the second function explains (0.643)<sup>2</sup> or 41.73% of the remaining variance (58.23%) that comes to 24.29%. Consequently , the two functions together explain 72.59% of the total variance in the newspaper choice of the readers.

The interpretation of earlier results is supported by standardized discriminant functions coefficients and structure matrix reported in Table 8 and Table 9, respectively. The standardized coefficients indicate a large coefficient for simple language and credibility of news reported; whereas, function 2 has a relatively large coefficient for political reasons and news coverage. The analysis of the structure matrix also helps to make a similar conclusion.

The table 10 provides the discriminant weights of four attributes and group means of each brand on the functions. On looking into group means of each brand, the first functions primarily distinguishes the Dainik Bhaskar from the remaining newspaper however, marked differences can be observed between Hindi newspaper English dailies. The second function also separates Dainik Bhaskar from other brands and by this most separation is found between Dainik Bhaskar and The Tribune. Therefore, we can form an impression that both function are almost same in their capacity to discriminate the newspaper brands. As we earlier, the third function is the weakest in the system.

Finally, we should again determine the predictive accuracy level of the discriminant function for assessing overall fit model. The hit ratios for the estimation sample, holdout sample, and cross validation were separately, and the same are reported in Table 11. Both estimation and cross validation samples have the same ratio of 72.10%. Therefore, the first two discriminant functions in combinations achieve a high degree classification accuracy. Thus, 72.1% of original grouped cases are correctly classified. However, the hit ratio the hold out sample falls to 64.61%. The hit ratio must be compared with the proportional chance (threshold value) to access their internal validity and thereby, the true effectiveness.

The proportional chance criteria is computed by adding the square of proportions of each group with a calculated value 33.35% (041.812+36.932+10.452+10.812). In the estimation sample the level classification accuracy in all of the individual groups is substantially higher then the threshold value and same is true in the case of hold out sample also, which indicates an accepted level of classification. Thus, discriminant procedure executed in this research are inferred to be valid and affected. The MDS analysis is done at the individual respondent level, enabling us to segment newspaper in Haryana according to similarities in the respondent's expectations. The students, who constitute the respondents, are clustered based upon their similarity with respect to original preference rating and ideal points established each segment. The respondents ranked their reading motivations in the order where updating the information's preferred first followed by widening general knowledge. Political news is provided the least significance by Students while reading newspapers the preference ranking along with the coordinates of the spatial map, the presence of diverging motives among readers when they read newspaper.

### Table 11. Classification Results

-510-

The discrimination analysis has been administered to make out he perceptual differences of readers based on their newspaper choices. We expect that the analysis of differences in terms of the attributes that the readers consider in the selection of newspapers can widen the readership base in Haryana through efficient news delivery. Four newspaper brands were selected, and readers' perceptions were measured on five attributes. The analysis offers valid findings on the attributes that distinguish newspaper brands and suggests the needed changes. There are primly two dimensions of discrimination among the newspaper brands. The first dimension is reflected by language simplicity and news credibility. In contrast, the second dimension is featured in terms of political bias and coverage of news. There is another dimension solely characterized by news content, which does not qualify the statistical test of validity.

Profiling the four newspapers on the specified dimensions and attributes related thereto would help managements to make out the perceptual differences among the readers and enable them to design opposite strategies to widen their newspaper circulation. The leading Hindi daily, Dainik Bhaskar is perceived at a higher scale among the groups selected. All the four statistically significant attributes of this brand are perceived at a scale higher than the other brands. Except for political reasons, this brand is comparable to its close competitor. Language simplicity along with political reasons separate this brand from the leading Hindi Dailies circulated in the State.

# 5. CONCLUSION

This research investigates the reading motivations and preferences of youth towards the print newspapers in Haryana. A survey of 352 college Students between the age of 18 to 25 years from different parts of the state revealed the youth's inclination to adopt a utilitarian approach towards newspaper reading. The study has been able to validate the findings with the support of a comprehensive statistical framework. The multi-dimensional scaling (MDS) technique employed in the study tells the presence of diverging motives among young readers of choices. Interestingly, the findings suggest language simplicity and political reasons as prime factor that discriminate Hindi Dailies from the leading English Dailies. However, the readers who favored content quality preferred Hindi Dailies.

# 6. MARGINAL IMPLICATIONS

The findings from their research confirm the fact that the variety and scope of youth preferences towards news attributes is indeed a strong differentiating factor. The study has many policy implications. The Dainik Bhasker, which is striving for its circulation growth, can attract new readers by focusing more on political news and better news coverage. Hindi Dailies should reduce the amount of language jargons while reporting news to enhance the level of understanding of news and to build a stronger readership base. Times of India newspaper should cover more political news to uplift readers' interest, a strategy which will help it to counter the circulation strategies of its close competitor. The Tribune, when these changes occur, the potential readers are expected to be more committed to the relationship ensuring long-run reader relations.

The gaps in the spatial map indicate potential opportunities for the newspaper brands in Haryana to increase their subscription rate by different reader groups.

# 7. LIMITATIONS OF THE STUDY AND SCOPE FOR FURTHER RESEARCH

The results of the study stem from the responses on limited questions on newspaper motives and preferences among Students in Haryana. The study is not free from limitations. The Findings of this study are limited to selected students respondents from Haryana, a relatively small state in India. Using alternative methodologies, incorporating large samples, and covering different age groups in and outside Haryana would definitely improve further analysis and significance of the study on this issue. These are possible and definitely can be added to the future line of newspaper research in India.
